

Installing Agent on Windows

There are two (2) methods of installing the Backup Agent:

- **Deploying Remotely** - Using the "Deploy Agent" feature available on the "Servers" screen or in the "Add a Server" Wizard" in the Backup Manager interface
- **Installing Locally** - Downloading the Backup Agent installation file and running it manually in the Server machine

After the installation is complete, **a reboot is required** in order to successfully accomplish backups.

For detailed instructions on how to install the Backup Agent, refer to the following pages:

- [Deploy Backup Agent on Windows from Backup Manager](#)
- [Installing Backup Agent on Windows Manually](#)
