

Creating a user

When creating a user in the backup system, they must be created as a power user in order to limit them from modifying their installed agent and disk safe.

On the backup web page, select Users from the menu on the bottom left.

Once on the Users page, select Create New User from the top left.

A popup should appear in the center of the screen and should have three different tabs: Settings, Agents, Volumes.

In the Settings tab, fill in the customers username (normally their account name), password, and e-mail address, as well as ensuring that the check-boxes for "Restrict maximum agent count" and "Restrict maximum MySQL add-on count" are checked and have the appropriate number of agents and database add-on's as per the amount they are paying for.

Create New User

Settings Agents Volumes

Identification

| | |
|------------------|---|
| Username | vaultdemo |
| Password | |
| Confirm Password | |
| Name | |
| E-mail Address | vaultdemo@vaultnetworks.com |
| Language | English |
| User Type | <input type="radio"/> Super-User <input checked="" type="radio"/> Power-User |

Settings

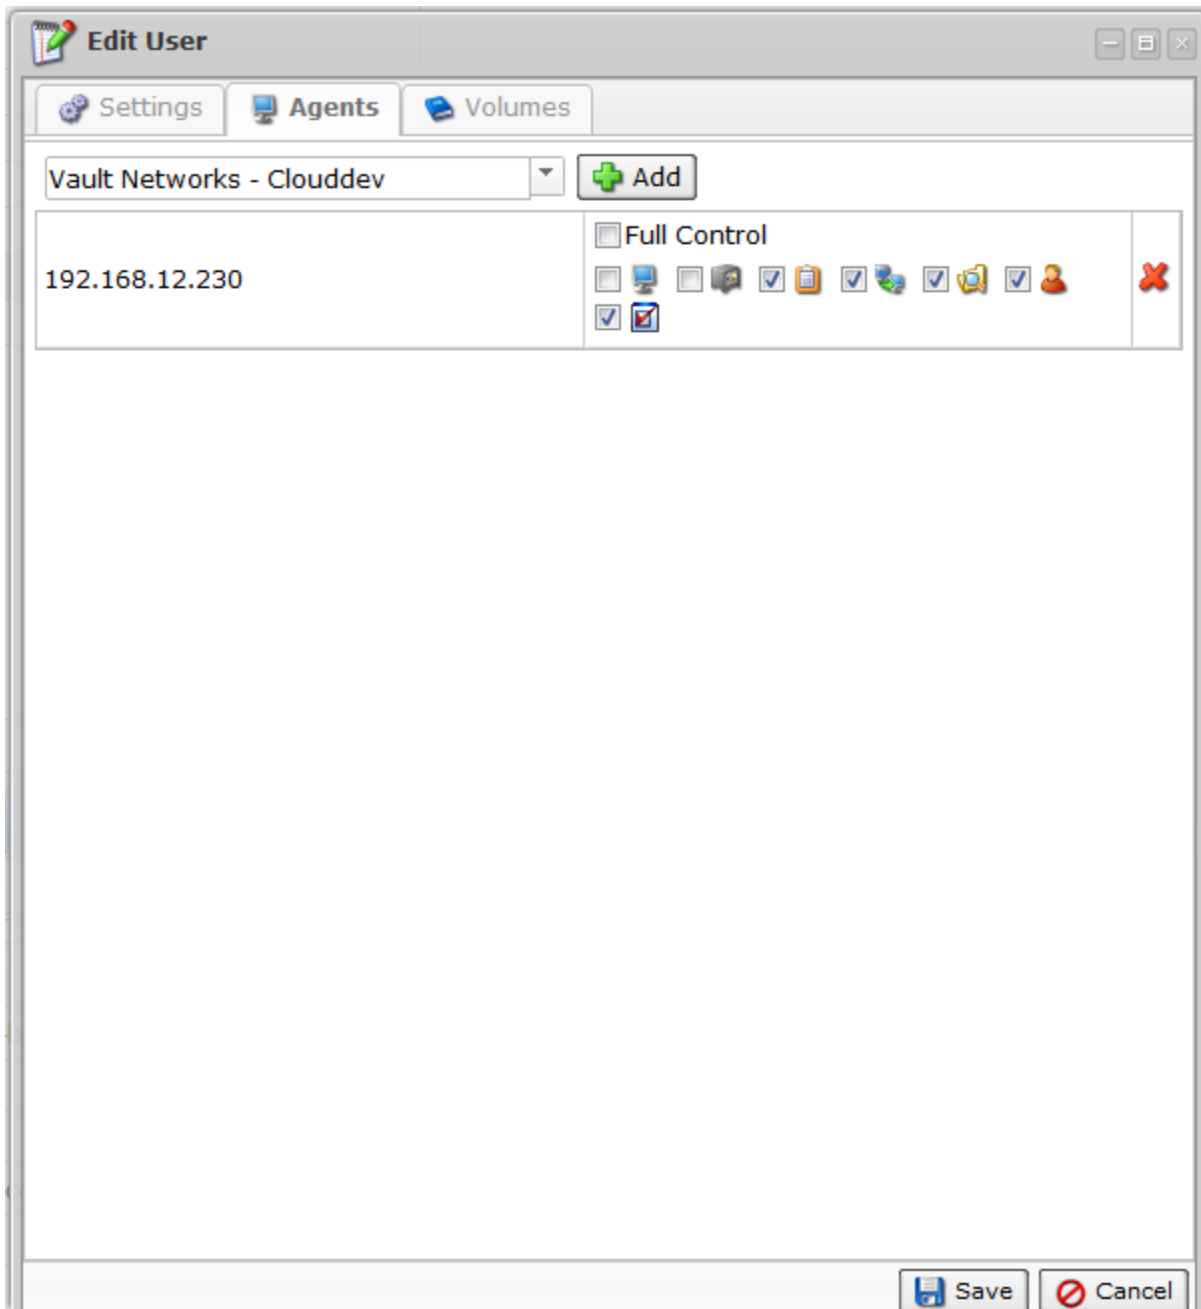

Restrict maximum sub-user count

User can create and administrate agents

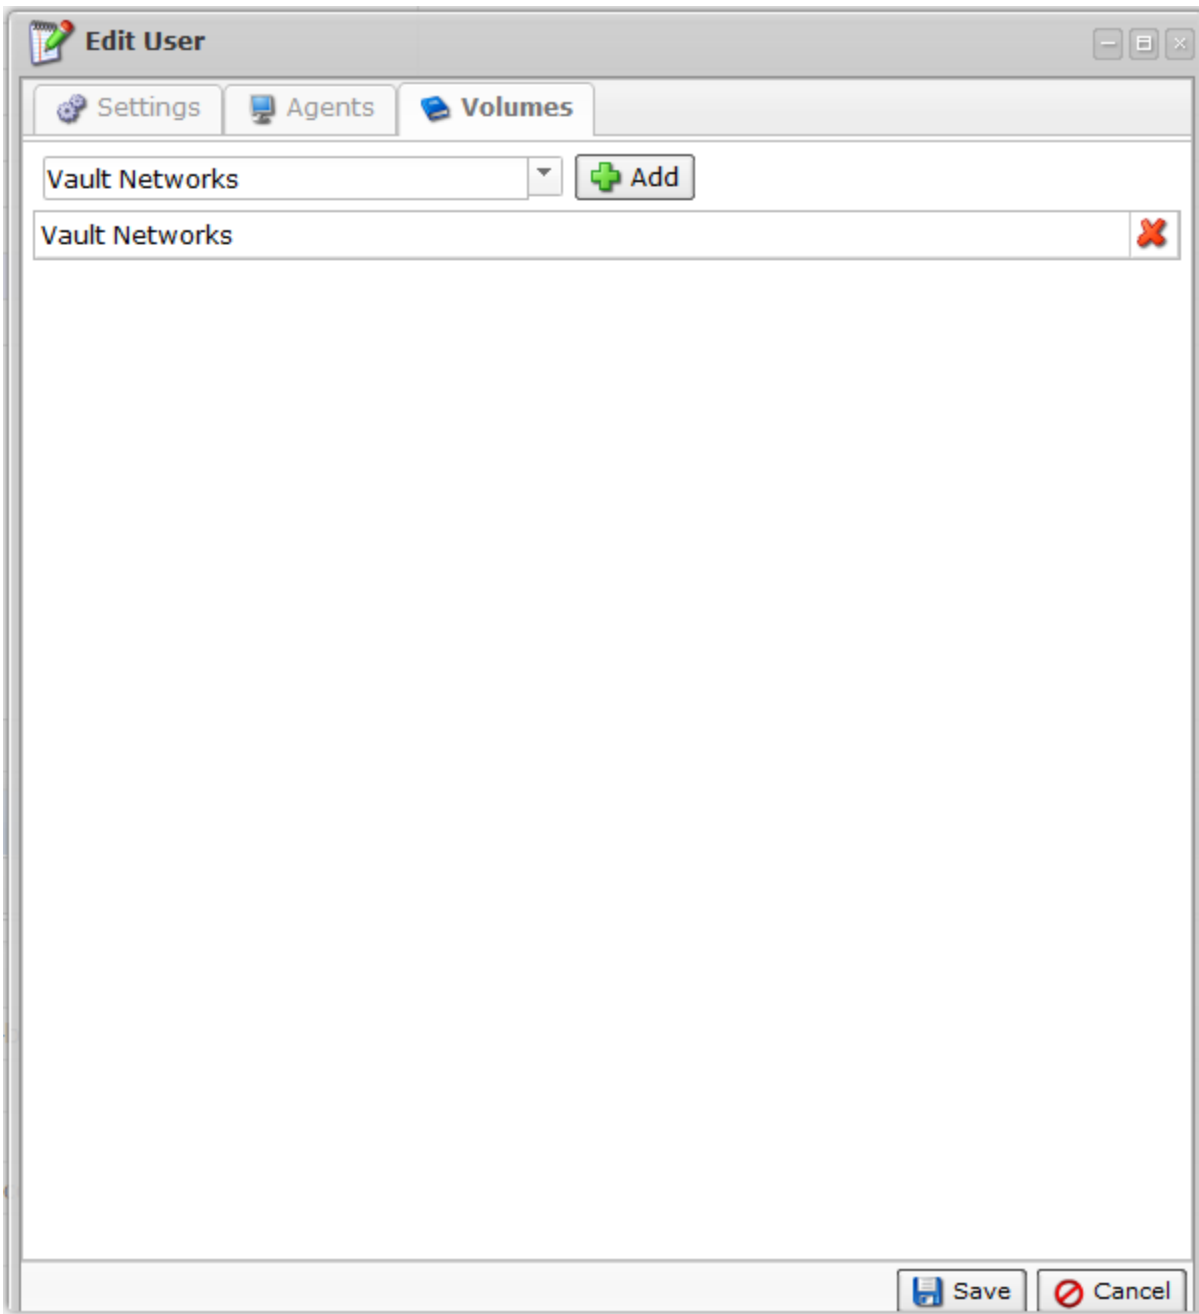

Restrict maximum agent count 1

Restrict maximum MySQL add-on count 0

In the Agents tab you see a drop-down box with all the currently installed agents. If the agent has not yet been created, it will need to be installed before this portion of user creation can be completed. Select the users agent and click add, then select the checkboxes as seen below.

Next, in the Volumes tab, simply select the users volume from the dropdown box and click add.

Once these three tabs have been completed, click on Save. The user has been successfully created and can login with their given credentials as well as receive any reports which they create.
